

FTP (FILE TRANSFER PROTOCOL) VS SFTP (SECURE FILE TRANSFER PROTOCOL) SECURITY

1. **OBJECTIVE:** The aim of this project is to demonstrate the security differences between FTP and SFTP by configuring, analyzing, and comparing their file transfer methods in a simulated environment. It aims to show how FTP exposes data due to lack of encryption, while SFTP secures data using encryption during both authentication and transfer.

2. FTP SETUP AND ANALYSIS

a) FTP configuration

To simulate an insecure file transfer environment, the vsftpd service was installed and configured on Kali Linux. The configuration allowed anonymous access and a test file named credentials.txt was placed in the directory /srv/ftp/files/ and made accessible with proper permissions

b) FTP file transfer procedure

The FTP client connected using anonymous login and downloaded the file using the get command after navigating to the appropriate directory

c) FTP traffic capture

Wireshark was used to capture FTP packets on the loopback interface with the appropriate filter. The FTP session showed all traffic in plaintext, including login credentials and file contents.

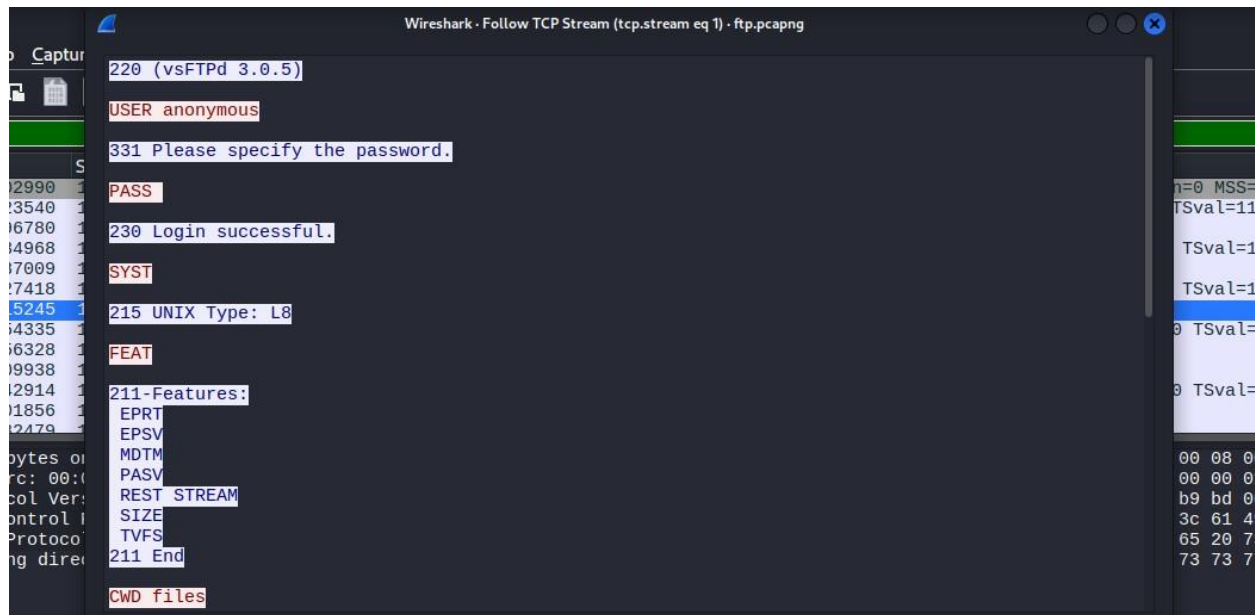

i. Terminal showing FTP session and get command

```
(loispc@kali)~$ sudo chown -R ftp:ftp /srv/ftp
(loispc@kali)~$ ftp 127.0.0.1
Connected to 127.0.0.1.
220 (vsFTPD 3.0.5)
Name (127.0.0.1:loispc): anonymous
331 Please specify the password.
Password:
230 Login successful.
Remote system type is UNIX.
Using binary mode to transfer files.
ftp> cd files
250 Directory successfully changed.
ftp> get credentials.txt
local: credentials.txt remote: credentials.txt
229 Entering Extended Passive Mode (|||52988|)
150 Opening BINARY mode data connection for credentials.txt (30 bytes).
100% |*****| 30 71.10 KiB/s 00:00 ETA
226 Transfer complete.
30 bytes received in 00:00 (22.88 KiB/s)
ftp> bye
221 Goodbye.
```

ii. Wireshark showing USER, PASS, and RETR commands

iii. TCP stream showing credential.txt in plaintext

3. SFTP SETUP AND ANALYSIS

a) SFTP configuration

SFTP was tested using the built-in OpenSSH server. The existing user account 'loispc' was used to transfer a test file named credential.txt located in the /srv/ftp/files/ directory.

b) SFTP file transfer procedure

An SFTP session was established and the file was downloaded securely using the get command. The SSH fingerprint was verified upon first connection.

c) SFTP traffic capture

Wireshark was used to capture SSH traffic. The SFTP session was encrypted, and no credentials or file content were visible in the packet capture.

i. SFTP showing file transfer

```
(loispc@kali)-[~]
└─$ ftp 127.0.0.1
Connected to 127.0.0.1.
220 (vsFTPd 3.0.5)
Name (127.0.0.1:loispc): anonymous
331 Please specify the password.
Password:
230 Login successful.
Remote system type is UNIX.
Using binary mode to transfer files.
ftp> files
?Invalid command.
ftp> cd files
250 Directory successfully changed.
ftp> get credentials.txt
local: credentials.txt remote: credentials.txt
229 Entering Extended Passive Mode (|||10505|)
150 Opening BINARY mode data connection for credentials.txt (30 bytes).
100% |*****| 30 31.50 KiB/s 00:00 ETA
226 Transfer complete.
30 bytes received in 00:00 (10.12 KiB/s)
ftp> bye
221 Goodbye.
```

ii. SSH fingerprint prompt

```
(loispc@kali)-[~]
└─$ ls -l -credentials.txt
ls: cannot access '-credentials.txt': No such file or directory

(loispc@kali)-[~]
└─$ sftp loispc@localhost

The authenticity of host 'localhost (::1)' can't be established.
ED25519 key fingerprint is SHA256:raVCKweTDAlbLOb1wr3bIXymko0s5Qyd9e8tJdJXTXA.
This key is not known by any other names.
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes
Warning: Permanently added 'localhost' (ED25519) to the list of known hosts.
loispc@localhost's password:
Connected to localhost.
sftp> ls
Desktop Documents Downloads Lois_First Music Pictures Public Templates Videos
credentials.txt
sftp> get credentials.txt
Fetching /home/loispc/credentials.txt to credentials.txt
credentials.txt
sftp> bye

(loispc@kali)-[~]
└─$
```

iii. Wireshark showing SSH encrypted packages

The image shows a Wireshark packet capture of an SSH session. The top pane displays a list of packets, with the selected packet (No. 39) showing details of an SSHv2 Encrypted packet (len=356). The bottom pane shows the raw packet data in hexadecimal and ASCII, with the ASCII column displaying the characters 'p @ @'.

No.	Time	Source	Destination	Protocol	Length	Info
35	50.117844631	::1	::1	SSHv2	626	Server: Encrypted packet (len=540)
36	50.119719353	::1	::1	SSHv2	158	Server: Encrypted packet (len=72)

FTP should not be used for transferring sensitive data across networks due to its lack of encryption. SFTP provides a secure alternative by encrypting both the authentication and data transfer process, making it suitable for use in compliance-regulated environments such as finance and healthcare.

This project provided practical experience with network services and packet analysis. Challenges such as permissions errors, chroot restrictions, and interface selections in Wireshark reinforced the importance of understanding both system and network layers in cybersecurity.

6. CONCLUSION

This project successfully demonstrated the difference between insecure and secure file transfer methods. FTP was shown to expose sensitive data, while SFTP protected data through encryption. The hands-on approach provided a deeper understanding of protocol-level security.
